Screenshot & Explanation

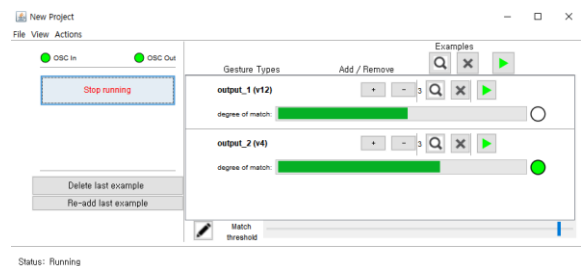

Output_1

Output_2

Output_1
Left to Right Shaking

Output_2
Up to Down Shaking

This is gesture interaction, which is detected the direction of moving.

With Wekinator input generator apps and MotionSender, the user can make movement. Also When the movement direction is left to right, then the output1 is go on, and if the direction goes to up and down, then the output2 is detected.

And following the direction, it appears two types of gesture interaction art with sequential circles. I think it can be more developed if another options would be added.
